

# System management

› The master system is managed via a 10" touch screen. From the display level, we configure the operation of individual machines. We choose the type of packaging, the speed of the devices. We have the option of choosing the routes for AGV vehicles as well as programming parking spaces. The software allows you to monitor the location of AGVs in your greenhouse in real time. The panel also includes statistical data on the logistics work performed. The panel also includes a diagnostic tool for machines and vehicles.
